

Interview Task: Payment Automation & Verification Tool

Deadline:

Please submit your solution to HR within 3 days from receiving this task. Shortlisted candidates will be invited for interview with demo session to present their solution to the Hiring Manager.

Objective:

You are required to design and develop an AI-Powered Payment Automation and Verification Tool that crosscheck the payment amount in the Payment Request Summary is it correctly match with the Payment supporting documents e.g. invoice.

The solution should leverage AI and automation technologies to verify supporting documents, validate payment amount and generate bank upload files for payments. The system must include a user-friendly graphical user interface (GUI) allowing users to upload payment summaries and invoices in order process payment requests through an AI-driven workflow.

Candidates may use any programming language, framework and AI-enabled development tool of their choice.

Background:

Currently, staffs processes payments which crosschecking if the payment amount in the Payment Request Summary is correctly matches the invoices daily. To strengthen internal controls and improve operational efficiency, the company is seeking an AI solution that can automatically verify payment amount before payment execution.

Task Description:

Using the provided sample files, develop a solution that automates payment amount verification and bank payment file preparation. The program shall support uploading the following files through a graphical user interface (GUI):

- Payment supporting documents e.g. invoice (PDF Format)
 - Payment Request Summary (Excel Format)
1. Upload the Payment Request Summary for crosschecking.
Payment Request Summary contains:
 - Payment Request No.
 - Payee Name
 - Bank Code
 - Bank Account Number
 - Particulars
 - Payment Amount
 2. Upload the Payment supporting documents e.g. invoice for checking. The system shall extract the invoice amount from the invoices using OCR technology and compare the extracted information against the Payment Request Summary. Only the "Payment Amount" needs to be validated:

3. The payment request that passed the verification should be included in the payment batch and be available for bank file generation. The system should generate a bank payment file in Excel formats. If any mismatch is identified, the transaction will not be included in the bank payment file.

Generated File Information:

- Payee Name (Follow the Payment Request Summary)
- Bank Account Number (Follow the Payment Request Summary)
- Payment Amount (Follow the crosscheck result)

Payee Name	Bank code and Account Number	Payment Amount (HKD)
e.g. ABC company	012-123142425	1230

GUI Requirements

The solution shall include a user-friendly and intuitive graphical user interface (GUI) for operations users. It is easy to navigate with minimal training.

- File Upload
The GUI shall provide an upload section allowing users to upload the Payment Request Summary (Excel Format) and payment supporting documents (e.g. invoice in PDF). Multiple files are supported to upload in one time.
- Bank File Generation and Reporting
Bank payment file (Excel Format) will be auto downloaded after verification.

Demo Session

During the online demo, you will:

- Run the program using the provided input files
- Use new files provided by the Hiring Manager during the demo to generate additional result.
- Explain your solution, including GUI operation and OCR technology, and how you used AI system for autonomous learning and development.

Resources Provided

- Payment supporting documents (PDF format)
- Payment request summary (Excel Format)

Submission Instructions

- Submit the completed project through a Git repository.
- Email your bank payment file to HR by the deadline.
- Be prepared to present your solution in interview, where you will run the demo session
